DIGITAL CITIZEN
mobile identity platform

Our solution combines mobile identity with physical products, enabling documents besides being physically produced on paper or card, to be available and authenticated on mobile devices as well.

ANY SECURITY PRINTING COMPANY

Based on the partner's requirements - by creating a new system or adapting to the existing infrastructure and database - all different types of personal identification documents, such as identity card, driving licence, passport, visa, refugee's card, residence permit, work permit card, student ID card, employee registration, medical documents, shall be uploaded, stored, and authenticated with the use of ANY's application.

The application was developed for Android smartphones with security in mind, while keeping the cost of the required equipment as low as possible. For full functionality, an NFC- and Bluetooth-enabled device is required. An optional Bluetooth fingerprint reader is required to capture fingerprint scans.
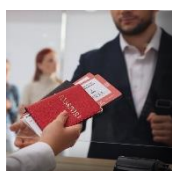

The customisable document checker and person identification application can be a great tool in the hands of various authorities, which may include border control officers, law enforcement officials or even government agency administrators.

Main advantages

- ➢ low cost and easy implementation
- ➢ all-in-one, intuitive application
- ➢ connectable to both national and international databases
- ➢ complex background system for secure operation
- ➢ multiple authentication possibilities
- ➢ customization for individual needs
- ➢ offline operation

Main areas of use

Border Control

- ▪ passport renewal or border control system installation project
- ▪ easily identify people without using fixed terminals

Law Enforcement

- ▪ check identity documents even in areas without an active internet connection
- ▪ compare the citizens' portrait with up-to-date criminal records

Governmental Offices

- ▪ applying for a new document or proving one's identity
- ▪ citizens identification by portrait photo or fingerprint

This tiny printer uses the advantages of digital printing technology, which is able to print variable elements that can be easily verified, using our smartphone application. As an example, it is able to produce variable UV patterns and variable microtext with elaborate errors.

The stamp contains a special QR code, called VLQR that contains the necessary data in a hidden layer. This layer can only be decoded and read by our own software as well.

The authentication process can be done completely offline, not relying on stable network connection. It is possible to add an extra layer of security with online functionalities. With our solution, the processes are centrally managed and automated.

Digital, blockchain validation
Verifying the stored data

Hybrid Logic:
Data from the physical document also stored on a server

Physical security
substrate, microtext, UV ink

Besides its use by authorities, the stamp can be applied in many other areas

- ➢ security official documents
- ➢ verifiable company stamp
- ➢ university certificates

- ➢ HR documents
- ➢ medical receipts
- ➢ cheques
